*Should it not be A and B? You need to assign different NIC's to machines for it to work.
I don't think C is needed. The question does not reference anything about distributing to healthy servers only, just distributing the traffic evenly.*

Typical configuration...BC correct

upvoted 2 times

vivikar 1 year, 4 months ago

Answer: BC

B - configure the load balancing rule, which maps the frontend IP with backend Pool.

C - monitor the Backend pools

Can anybody explain why BC is correct. Instead of just religiously repeating the mantra 'it is correct'.

Any reference docs?

You have an explanation in the docs posted in the answer, which says:

During the creation of the load balancer, you'll configure:

Frontend IP address

Backend pool

Inbound load-balancing rules

Health probe
