Traffic from West Europe:

Based on TM1 table, West Europe will trigger TM2. However, as the MinChildEndpoint is set to 2, and App4 is degraded (down), the entire TM2 will not be considered available.

This goes back to the origin TM1 that uses performance traffic-routing method, which means the closest location is App1 and naturally be the next best performance instance.

Hence, Answer = App1

Traffic from West US:

Based on TM1 table, West US will trigger TM3. However, both App2 and App6 were degraded (down), so none of them can be considered.

This goes back to the original TM1 that uses performance traffic-routing method, from TM1, the other 2 US locations would be App2 and App3. But App2 we know it's already degraded (unavailable), hence the only option would be App3.

Answer = App3

App5 and App3 is correct

upvoted 1 times

geuser 1 year, 6 months ago

it cannot be App5 because MinChildEndpoint = 2 not 1 (which is default).

There is traffic-routing method with MinChildEndpoint = 2. The parameter determines the minimum number of available endpoints in the child profile. So the parent profile considers the entire child profile to be unavailable and directs traffic to the other endpoints.
